

**LrC: Lordstown-Rock outcrop complex, 5 to 15 percent slopes**

The Lordstown component makes up 55 percent of the map unit. The natural drainage class is well drained. Water movement in the most restrictive layer is low. This component is on hills on glaciated uplands. The parent material consists of coarse-loamy till. Depth to a root restrictive layer, bedrock, lithic, is 20 to 40 inches.

The Rock outcrop component makes up 30 percent of the map unit. Water movement in the most restrictive layer is low. This component is on hills on glaciated uplands. Depth to a root restrictive layer 0 inches, bedrock, lithic,.

**Important farmland classification:** NPSL

**Land capability:** 3 e

**Vermont Agricultural Value Group:** 10

**Vermont Residential Onsite Waste Disposal Group and Subgroup:** IVc

This unit is generally not suited as a site for soil-based residential wastewater disposal systems, based on a review by the Natural Resources Conservation Service of criteria set forth in the Vermont 2007 Environmental Protection Rules. The very shallow to shallow depth to bedrock is the limiting condition.
