

Pa: Peacham mucky peat, 0 to 8 percent slopes, very stony

The Peacham, undrained component makes up 80 percent of the map unit. The natural drainage class is very poorly drained. Water movement in the most restrictive layer is very low. This component is on depressions on glaciated uplands. The parent material consists of coarse-loamy basal till. Depth to a root restrictive layer, densic material, is 9 to 16 inches.

Vermont Residential Onsite Waste Disposal Group and Subgroup: IVa

This unit is generally not suited as a site for soil-based residential wastewater disposal systems, based on a review by the Natural Resources Conservation Service of criteria set forth in the Vermont 2007 Environmental Protection Rules. Excessive soil wetness in association with the minimal slope is the limiting condition. Prolonged periods of saturation at or near the soil surface do not allow for the proper functioning of septic systems.
