

**WxD: Woodstock-Rock outcrop complex, 15 to 25 percent slopes**

The Woodstock component makes up 50 percent of the map unit. The natural drainage class is somewhat excessively drained. Water movement in the most restrictive layer is low. This component is on mountains on glaciated uplands, hills on glaciated uplands. The parent material consists of coarse-loamy till. Depth to a root restrictive layer, bedrock, lithic, is 10 to 20 inches.

The Rock outcrop component makes up 40 percent of the map unit. Water movement in the most restrictive layer is low. This component is on hills on glaciated uplands, mountains on glaciated uplands. Depth to a root restrictive layer 0 inches, bedrock, lithic,.

Important farmland classification: NPSL

Land capability: 6 e

Vermont Agricultural Value Group: 10

Vermont Residential Onsite Waste Disposal Group and Subgroup: IVc

This unit is generally not suited as a site for soil-based residential wastewater disposal systems, based on a review by the Natural Resources Conservation Service of criteria set forth in the Vermont 2007 Environmental Protection Rules. The very shallow to shallow depth to bedrock is the limiting condition.
