

AgE: Agawam fine sandy loam, 25 to 50 percent slopes

The Agawam component makes up 85 percent of the map unit. The natural drainage class is well drained. Water movement in the most restrictive layer is high. This component is on dissected terraces on river valleys. The parent material consists of coarse-loamy glaciofluvial deposits over sandy and gravelly glaciofluvial deposits. Depth to a root restrictive layer is greater than 60 inches.

Important farmland classification: NPSL	Land capability: 7 e	Vermont Agricultural Value Group: 11

Vermont Residential Onsite Waste Disposal Group and Subgroup: IIe

This unit is moderately suited as a site for soil-based residential wastewater disposal systems, based on a review by the Natural Resources Conservation Service of criteria set forth in the Vermont 2007 Environmental Protection Rules. The rapid permeability in the substratum and slopes greater than 20 percent are the primary concerns. Backfilling absorption trenches and beds with at least one foot of finer textured material, or other site modifications, may be necessary to slow the percolation rate enough to allow for thorough filtering of effluent. Cut and fill site modifications may produce an acceptable area within the unit. An erosion prevention and sediment control plan is required by the State for construction on sites over 20 percent slope.

PHYSICAL and CHEMICAL PROPERTIES							EROSION FACTORS		
Soil name	Depth (In)	Typical texture	Clay (Pct)	Soil reaction (pH)	Permeability (In/Hr)	Organic matter (Pct)	Kw	Kf	T
Agawam	0-9	FSL	4-10	4.5 - 6.5	2-6	1.0-5.0	.24	.24	3
	9-23	FSL	1-10	4.5 - 6.5	2-6	0.5-3.0	.32	.32	
	23-60	FS	1-2	4.5 - 6.5	6-20	0.0-1.0	.02	.02	

WATER FEATURES						SOIL FEATURES
