

PsD: Pomfret very stony loamy fine sand, 8 to 25 percent slopes

The Pomfret component makes up 85 percent of the map unit. The natural drainage class is somewhat excessively drained. Water movement in the most restrictive layer is low. This component is on hills on glaciated uplands, ridges on glaciated uplands. The parent material consists of sandy till. Depth to a root restrictive layer, bedrock, lithic, is 40 to 96 inches.

Important farmland classification: NPSL	Land capability: 6 s	Vermont Agricultural Value Group: 9
---	----------------------	-------------------------------------

Vermont Residential Onsite Waste Disposal Group and Subgroup: Ild

This unit is moderately suited as a site for soil-based residential wastewater disposal systems, based on a review by the Natural Resources Conservation Service of criteria set forth in the Vermont 2007 Environmental Protection Rules. The depth to bedrock and slopes greater than 20 percent in some areas are the primary concerns. A significant percentage of this map unit has sufficient soil depth over bedrock to accept a range of designs. On-site investigations can help avoid areas with limited depth to bedrock. Additional fill material may be needed in some areas in order to meet the separation distance requirement between the bottom of the leachfield and bedrock. There may be less-sloping areas within the unit that are suitable for siting a septic system, or, if feasible, cut and fill site modifications may produce an acceptable area within the unit. An erosion prevention and sediment control plan is required by the State for construction on sites over 20 percent slope.

PHYSICAL and CHEMICAL PROPERTIES							EROSION FACTORS		
Soil name	Depth (In)	Typical texture	Clay (Pct)	Soil reaction (pH)	Permeability (In/Hr)	Organic matter (Pct)	Kw	Kf	T
Pomfret	0-3	LFS	1-7	5.6 - 7.3	2-20	2.0-8.0	.17	.17	3
	3-30	LS	1-7	5.6 - 7.3	2-20	0.5-3.0	.15	.15	
	30-58	LS	1-5	6.1 - 7.3	6-20	0.0-1.0	.15	.15	
	58-68	WB	---	---	0.01-20	---	---	---	

WATER FEATURES						SOIL FEATURES
