

**14B: Irasburg loamy fine sand, 3 to 8 percent slopes**

The Irasburg component makes up 75 percent of the map unit. The natural drainage class is moderately well drained. Water movement in the most restrictive layer is low. This component is on lake terraces. The parent material consists of sandy glaciofluvial deposits over silty glaciolacustrine deposits. Depth to a root restrictive layer is greater than 60 inches.

Important farmland classification: Prime

Land capability: 2 w

Vermont Agricultural Value Group: 3

Vermont Residential Onsite Waste Disposal Group and Subgroup: IIh

This unit is moderately suited as a site for soil-based residential wastewater disposal systems, based on a review by the Natural Resources Conservation Service of criteria set forth in the Vermont 2007 Environmental Protection Rules. The depth to the seasonal high water table is the primary concern. Mound system construction and other site modifications are often necessary. On sloping sites, curtain drains can help lower the water table to an acceptable level. In some cases, a detailed, site-specific analysis with groundwater level monitoring and determination of induced groundwater mounding may be required to establish the suitability of this unit.
