

33A: Moosilauke very fine sandy loam, 0 to 3 percent slopes

The Moosilauke component makes up 84 percent of the map unit. The natural drainage class is poorly drained. Water movement in the most restrictive layer is high. This component is on outwash plains, stream terraces. The parent material consists of sandy and gravelly glaciofluvial deposits. Depth to a root restrictive layer is greater than 60 inches.

Vermont Residential Onsite Waste Disposal Group and Subgroup: IVa

This unit is generally not suited as a site for soil-based residential wastewater disposal systems, based on a review by the Natural Resources Conservation Service of criteria set forth in the Vermont 2007 Environmental Protection Rules. Excessive soil wetness in association with the minimal slope is the limiting condition. Prolonged periods of saturation at or near the soil surface do not allow for the proper functioning of septic systems.
