

58A: Grange silt loam, 0 to 3 percent slopes

The Grange component makes up 85 percent of the map unit. The natural drainage class is poorly drained. Water movement in the most restrictive layer is moderately high. This component is on depressions on outwash terraces on river valleys. The parent material consists of coarse-loamy glaciofluvial deposits over sandy and gravelly glaciofluvial deposits. Depth to a root restrictive layer is greater than 60 inches.

Important farmland classification: Prime (b)	Land capability: 3 w	Vermont Agricultural Value Group: 3d
--	----------------------	--------------------------------------

Vermont Residential Onsite Waste Disposal Group and Subgroup: IVa

This unit is generally not suited as a site for soil-based residential wastewater disposal systems, based on a review by the Natural Resources Conservation Service of criteria set forth in the Vermont 2007 Environmental Protection Rules. Excessive soil wetness in association with the minimal slope is the limiting condition. Prolonged periods of saturation at or near the soil surface do not allow for the proper functioning of septic systems.
